

AI Visibility Audit

Sample Report

SUBJECT	Meridian Aesthetics Med Spa
CATEGORY	Med spa / aesthetics clinic
MARKET	MetroWest, Orlando, FL
TEST DATE	8 August 2026
PREPARED BY	Kenny Chantasi, DO · AnswerFoundry LLC

This is a sample report. The subject is a real, independently owned Orlando-area med spa. Its name, address, and practitioner identity have been changed, and competitors are referred to by letter. Every finding, count, and observation below is real and was recorded on the date shown. Nothing in this document is invented, estimated, or rounded. Where something could not be verified, it is labeled *not verified* rather than filled in.

01 Executive summary

Meridian is a well-run practice with a data problem, not a quality problem. It holds a 5.0 rating across 214 Google reviews, the owner responds to reviews, the state license is clear with no discipline or complaints on file, and it ranks first organically for its signature device treatment. It is also close to invisible in the places AI answers are actually assembled from.

The split is unusually clean, and it is the most useful thing in this report. Where Google's own first-party data decides the answer — Maps, the local pack — Meridian performs well, appearing in both local queries tested and ranking second in its own neighborhood. Where the answer is assembled from third-party editorial and directory text — category listicles, review aggregators, vertical directories — Meridian appears in almost nothing. It was absent from all four "best med spa in Orlando" roundups examined, has no RealSelf presence, and its entries on three aggregators are unclaimed and carry review counts between 2 and 38 against a real count of 214.

That matters because AI assistants lean heavily on the second category. A business can own the map and still never be named in a generated answer.

Underneath that sit three compounding technical issues. The service pages — the pages that would answer "where do I get X in Orlando" — carry no structured data at all. The homepage has no `H1` and its only `Person` markup names the web developer's admin account rather than the clinician. And the 214 reviews, the practice's single strongest asset, live inside a third-party iframe, meaning they are invisible to any crawler or model reading the page.

None of this is exotic. All of it is fixable, and the highest-value fixes cost nothing but attention.

27/100

AnswerFoundry Visibility Score

A proprietary assessment, not a standardized industry metric. See \$15 for the full category breakdown and how each score was reached.

The five things that matter most

- 1 **Meridian appears in 2 of 8 scored unbranded queries** — and in one of those two, only through a third-party listing that displays it at 3.0 stars from 2 reviews rather than 5.0 from 214.

- 2 **Four different suite numbers are in public circulation** for one address: Suite 1 (the state record), Ste 2, Suite 20, and no suite at all. Six variants of the business name are live simultaneously.
- 3 **Service pages carry zero structured data.** Not thin markup — none. No `Service` , no `FAQPage` , no `Offer` , no `MedicalProcedure` .
- 4 **214 reviews are invisible to machines.** They render inside an off-domain iframe, and no `Review` or `AggregateRating` markup exists anywhere on the site.
- 5 **Competitors are winning on published text, not on quality.** One competitor ranks first for "physician owned med spa Orlando" with 27 reviews — against Meridian's 214 — because it states that phrase plainly on its homepage and Meridian states nothing comparable anywhere.

What's already working

5.0 / 214 Google reviews with active owner responses. A Google Post published within the last week. A clear, active state license with no discipline or public complaints. First organic result for the signature device treatment. Consistent phone number across every source checked — the one clean identifier in the entire data set. This is a practice with real equity that is not being represented off-site.

02 Business profile and tested entity

An audit is only as good as the entity it tests. Before running a single prompt we establish what the business actually is, according to sources that can be verified independently of the business's own marketing.

ATTRIBUTE	VALUE	SOURCE OF TRUTH
Business type	Independently owned med spa, single location	State corporate record; no chain affiliation found
Ownership model	Nurse-practitioner owned, operating under physician oversight	Practice's own About page
Lead practitioner	APRN, Nurse Practitioner qualification	Florida DOH MQA license verification, data as of 8 Aug 2026
License status	Clear / Active · original issue 2020 · no discipline on file · no public complaint	Florida DOH MQA
Address of record	Suite 1, MetroWest, Orlando, FL 32835	Florida DOH MQA — this is the authoritative address
Premises	A single suite inside a shared salon-suite building	Building operator's own directory
Google rating	5.0 from 214 reviews	Google Maps, 8 Aug 2026
Indexable pages	32 URLs total — 8 site pages plus 24 service pages. No blog.	Site XML sitemaps
Published pricing	None on the practice website	Verified: zero occurrences of price indicators on service pages

The tested entity is the business, not the website. This distinction drives most of what follows: AI systems resolve a business across many sources, and Meridian's website is only one of roughly a dozen places where its identity is asserted — several of which it does not control and has not claimed.

03 Platforms tested

Scope disclosure — read before interpreting any result

This sample report was compiled without a client engagement. Testing covered the public retrieval substrate — the indexed sources AI systems draw on — and Google's local surfaces. **Conversational AI assistants were not queried directly for this sample.** No ChatGPT, Perplexity, Gemini, Claude, or Copilot session was run, and no finding below should be read as an AI assistant's answer.

In a paid Foundry Audit, each assistant listed below is queried directly, under a defined location context, with the exact prompt text, date, full response, and a dated screenshot logged for every run — favorable or not. That log is the deliverable. This sample shows the structure and the reasoning; a client engagement fills the assistant rows with primary observation.

SURFACE	TESTED HERE	METHOD
Web search index	Yes	10 queries, US locale, 8 Aug 2026 — full result sets recorded
Google Maps / local pack	Yes	2 location-scoped queries, browser, 8 Aug 2026
Third-party directories & aggregators	Yes	9 platforms inspected directly
Site structured data	Yes	JSON-LD extracted from the live rendered DOM, 4 page types
State licensure record	Yes	Florida DOH MQA license verification
ChatGPT	Not tested	Direct assistant querying is performed in a client engagement, not in this public sample
Perplexity	Not tested	
Google AI Overviews / Gemini	Not tested	
Bing Copilot	Not tested	

04 Prompt methodology

Prompts are written the way a prospective patient would ask, not the way a marketer would search. Three families are used, and the mix is fixed before testing begins so results cannot be curated after the fact.

FAMILY	WHAT IT MEASURES	COUNT
Category discovery — "best med spa Orlando"	Whether the business is a candidate answer at all for high-intent, unbranded demand	6
Service-specific — "[treatment] Orlando FL"	Whether individual service pages surface independently of the brand	2
Adjacent / qualifier — ownership model, ZIP, neighborhood	Whether the business is retrievable when a customer adds a constraint	1
Branded control — "[business name] reviews"	Baseline: confirms the business is retrievable at all, isolating a discovery failure from an indexing failure	1

Rules of the method

- **The prompt set is fixed in advance.** Prompts are not added or dropped once results are seen.
- **Every run is logged, favorable or not.** A query where the business is absent is recorded with the same care as one where it wins. Cherry-picking is the single easiest way to make this kind of report worthless.
- **Location context is held constant** across a test cycle and recorded, because it materially changes results.
- **Non-fits are labeled as non-fits.** One prompt below asks for a physician-owned practice. Meridian is nurse-practitioner owned, so its absence is a correct result, not a failure. Counting that as a miss would inflate the problem.
- **Exact text is preserved.** Paraphrasing a prompt between cycles breaks comparability.

05 Share of answer

Share of answer is the percentage of relevant, unbranded queries in which the business appears as a candidate answer. It is the headline number, and on its own it is close to useless without the detail beneath it — which is why the full query log follows rather than a single figure.

Ten prompts were run: nine unbranded and one branded control. One of the nine — query 4 — is a legitimate non-fit and is excluded from the denominator rather than counted as a miss, which would overstate the problem. Share of answer is therefore scored across **8** queries. Query 6 counts toward the numerator even though Meridian surfaced only through a third party showing incorrect data, because the customer would still have seen the business named.

VISUAL 1 — PLATFORM VISIBILITY TABLE

#	QUERY (EXACT TEXT, 8 AUG 2026)	APPEARED?	HOW / NOTES
1	best med spa Orlando	No	7 competitors named; 4 of 9 result domains were third-party listicles
2	best med spa near me Orlando FL	No	9 competitors named
3	top rated botox Orlando	No	An aggregator holding an <i>unclaimed Meridian profile</i> took the top two result slots — and the profile never surfaced
4	physician owned med spa Orlando	N/A	Correct non-fit. Meridian is NP-owned. Included to map the competitive frame, excluded from scoring
5	best place for filler Orlando FL	No	9 competitors named
6	med spa MetroWest Orlando	Partial	Named first — but sourced from a review platform that displays Meridian at 3.0 from 2 reviews . Its own domain did not rank
7	[signature device] Orlando FL	Yes — #1	Own service page, first organic result. Low-competition device term
8	laser tattoo removal Orlando FL best	No	Notable: tattoo removal is Meridian's <i>most-reviewed service</i> on Google, with 53 review mentions

9	"[business name]" med spa Orlando reviews	Yes	Branded control. Dominant, as expected — this is an indexing check, not a discovery result
10	nurse practitioner owned med spa Orlando 32835 injectables	No	Absent even with its own ZIP code and its own ownership model in the query

Query 10 is the most diagnostic line in the table. A prospective patient who already knows they want an NP-owned injectables practice in Meridian's exact ZIP code would not be shown Meridian. That is not a ranking problem; it is an absence-of-published-text problem, and §12 explains why.

VISUAL 2 — LOCAL SURFACES, FOR CONTRAST

LOCAL QUERY	RESULT
med spa near MetroWest Orlando FL (Maps)	Ranked #2 in the local feed — 5.0 (214), correct address
best med spa Orlando FL (Maps)	Appeared in the local feed — 5.0 (214)

Two tables, one business, opposite outcomes. Meridian's Google Business Profile is doing its job. Everything downstream of Google's own data is not.

06 Competitors appearing

Competitors are anonymized and characterized only by observable, verifiable attributes. Google review counts were read directly from Maps on 8 August 2026. No judgment is offered about any competitor's quality of care.

VISUAL 3 — COMPETITOR COMPARISON

	GOOGLE REVIEWS	QUERIES APPEARED IN	OBSERVABLE ADVANTAGE OVER MERIDIAN
Meridian (subject)	5.0 / 214	2 of 8	—
Competitor A	4.9 / 525	4	Named physician on every page; ~60+ indexed treatment pages; <i>publishes its own "Top 10 Orlando Med Spas" listicle</i> that ranks for the head term and places itself first
Competitor B	5.0 / 809	3	Largest verified review base in the set; named in both third-party roundups examined
Competitor C	4.7 / 210	3	Named PA-C with a bio-led brand; dedicated ranking landing pages that surface directly in results — with <i>fewer</i> reviews than Meridian
Competitor D	5.0 / 285	2	Named PA-C owner; in the city top-10 list and a competitor roundup
Competitor E	5.0 / 27	2	Ranks #1 in Maps for Meridian's own neighborhood and first organically for "physician owned med spa Orlando" — on 27 reviews, by stating the positioning phrase plainly on its homepage

The Competitor E finding

Competitor E has 27 Google reviews. Meridian has 214 — roughly eight times as many — and outranks it on no query tested. E's advantage is not authority, spend, or review volume. It is that E says what it is, in plain words, on a page a machine can read. Meridian's ownership model appears nowhere in a page title, heading, or structured-data field.

This is the single most encouraging finding in the report, because the fix costs nothing.

Competitors A and C are worth a second look for a different reason: both publish their own category roundups. In this market, several of the "best of" lists that rank for the head term were written by competitors, who unsurprisingly rank themselves first. That is a legitimate, if self-serving, content strategy, and it is available to Meridian too — see §12.

07 Accuracy findings

Every row below is a data-consistency observation with a named source and an observation date. None of it is a characterization of the business.

VISUAL 4 — ACCURACY ISSUE TABLE

#	WHAT'S PUBLISHED	WHERE	CORRECT VALUE	SEV.
1	3.0 stars from 2 reviews	Major review platform — and this is the figure its neighborhood listicle propagates	5.0 from 214 (Google)	High
2	"5.0 from 180+ reviews"	Meridian's own site footer, every page	214	Med
3	5.0 from 30 reviews	Vertical directory (unclaimed)	214	Med
4	5.0 from 38 reviews	Aggregator (unclaimed)	214	Med
5	Suite 2	Review platform; financing partner	Suite 1	High
6	Suite 20	One of two live Facebook pages	Suite 1	High
7	No suite number	Manufacturer directory, booking platform, aggregator, second Facebook page	Suite 1	Med
8	Street name misspelled (dropped letter)	Financing partner	Correct spelling per state record	Low
9	Hours "10:00 AM - 6:00 PM"	Aggregator	No source anywhere supports a 10 AM open	Med
10	Structured data says open Sat 09:00–18:00 and weekdays to 18:00	Meridian's own JSON-LD	Its own visible page text says 5 PM close and two Saturdays a month, 9–12	High
11	"[Practitioner] is a doctor" — inside an auto-generated summary, alongside garbled text	Aggregator (unclaimed)	APRN, Nurse Practitioner — per state license	High
12	Practice address on a physician-directory profile is a different address entirely, in a different ZIP	Medical directory (unclaimed, "last verified July 2026")	Suite 1, 32835 — <i>though identity of that record is name-and-city match only, not confirmed</i>	Med

13	Two live Facebook pages, different names, follower counts, addresses, review counts	Facebook	One canonical page	High
14	Google Business Profile website field points to the <code>http://www.</code> variant	GBP	The site's own canonical is <code>https://</code> , no www	Low
15	A second live practitioner profile: different email, different credential wording, different device brand, and <i>a full price list the main site does not publish</i>	Building operator's directory	Both live simultaneously; neither is marked canonical	High

The hours contradiction is the one to fix first

Row 10 is a business contradicting itself inside a single page load. The visible text says one thing; the machine-readable markup on the same page says another; the Google Business Profile says a third. When sources disagree, a retrieval system has to pick — and the one it is least likely to pick is the one no source corroborates. A patient told the clinic is open Saturday afternoon who arrives to a closed door is a review risk on top of a visibility one.

Row 11 carries regulatory weight

A third-party page states the practitioner is a physician. She is an APRN with a clear, active license. Neither Meridian nor AnswerFoundry authored that text, and there is no suggestion Meridian caused it. But in a regulated profession, an uncorrected public claim of a credential the practitioner does not hold is the kind of thing that is far cheaper to fix than to explain later. See §14.

08 Missing services and attributes

This section asks a narrow question: if a customer described what they wanted in plain language, is there text anywhere that would let a machine match them to this business?

ATTRIBUTE A CUSTOMER MIGHT SPECIFY	TRUE OF MERIDIAN?	STATED IN A TITLE, HEADING, OR SCHEMA FIELD?
Nurse-practitioner owned / NP-led	Yes	No — body copy on one page only
Operates under physician oversight	Yes	No — body copy only
Female-owned	Yes	No — stated nowhere
12+ years of experience	Yes	Only on the building operator's profile, not Meridian's own site
Serves MetroWest / Dr. Phillips / Windermere / Ocoee / Kissimmee	Yes	Only inside a Google Post — no page on the site says this
Financing available	Yes	Logos on the homepage; no text, no schema
Pricing	Yes, internally	Published nowhere on the site — but is published on a third-party profile
Named, licensed practitioner	Yes	Named on the About page in body text only; absent from all structured data

Every row in this table is a true fact the business is not publishing in a readable form

This is not a content-creation problem. It is a transcription problem. Meridian already *is* everything a customer in query 10 asked for. It simply has not written it down anywhere a machine will find it.

The pricing row deserves particular attention. Meridian publishes no prices on its own site while a third-party profile publishes a full price list for the same practitioner. If a customer asks an AI assistant what a treatment costs at this practice, the only available answer comes from a page Meridian does not control and may not have reviewed recently.

09 Source and citation findings

This is the section most visibility reports skip, and the one that explains the results. Rather than asking "why isn't the business ranking," it asks: *which sources decide this category's answers, and is the business present in them?*

SOURCE TYPE	APPEARED IN	MERIDIAN'S STATUS
Review-platform category and neighborhood pages	7 of 10 queries, often multiple slots	Present but wrong — 3.0 / 2 reviews, wrong suite, name casing error. The most influential source in the category, showing the least flattering data.
Competitor-authored "Top 10 / Best of" posts	4 queries	Absent from all
Local-lifestyle "best of" publishers	2 queries; one roundup lists 17 businesses and was updated April 2026	Absent from all
Vertical aggregators & directories (7 identified)	5 queries	Present on at least 3 — all unclaimed, all stale
RealSelf — surfaces for injectable queries	1 query, prominently	No profile at all
Manufacturer find-a-provider pages	Underpins the one query Meridian wins	Present — and it works

Read that table twice

The one source type where Meridian has a clean, claimed presence — the device manufacturer's provider directory — is the mechanism behind the single query it wins outright. That is the pattern to replicate, not a coincidence.

The inverse is just as instructive. On the query "top rated botox Orlando," the top two results both came from an aggregator that *holds an unclaimed Meridian profile*. Meridian is inside the source that won the query, and still did not appear in the answer, because the profile is stale and unclaimed. The distance between "absent" and "present but unmaintained" is smaller than it looks, and both produce the same outcome.

Four of the roundups examined were authored by competitors or by local-lifestyle publishers with open submission processes. Inclusion in this kind of source is generally a matter of asking, correcting, and occasionally publishing your own — not of buying anything.

10 Website technical findings

All findings extracted from the live rendered DOM on 8 August 2026, not inferred from a crawler summary.

FINDING	DETAIL	IMPACT
Service pages carry no structured data	Zero JSON-LD blocks on the service page inspected. No <code>Service</code> , <code>FAQPage</code> , <code>Offer</code> , <code>MedicalProcedure</code> , or <code>Product</code> . These are the pages that answer treatment queries.	High
Reviews are invisible to machines	The reviews page renders ~555 characters of text; all review content sits in a third-party iframe. No <code>Review</code> or <code>AggregateRating</code> markup anywhere on the site.	High
Homepage has no H1	Zero <code>H1</code> elements. Four <code>H2</code> s. <code>H3</code> s duplicated by the page builder's desktop/mobile rendering, so every service name appears twice.	High
Structured data names the developer, not the clinician	The only <code>Person</code> node on the site is the web developer's WordPress admin account, with <code>worksFor</code> pointing at the business. The homepage is also marked up as an <code>Article</code> authored by that same account. The actual licensed practitioner appears in no structured data on any page.	High
Schema contradicts the visible page	<code>openingHours</code> asserts Saturday 09:00–18:00 and weekdays to 18:00; the visible footer says 5 PM and two Saturdays a month.	High
No <code>aggregateRating</code>, <code>geo</code>, or <code>sameAs</code>	All three absent from the business node, despite a rating rendered in every page footer and active profiles on 8+ external platforms.	Med
No medical-specific schema type	<code>HealthAndBeautyBusiness</code> is the most specific type used. No <code>MedicalBusiness</code> , <code>MedicalClinic</code> , or <code>Physician</code> .	Med
Head term missing from the money page	The injectables page is titled with an abbreviation. The actual head term appears once in 665 words, and is absent from the title, the <code>H1</code> , and the URL.	High
Possible sitemap/asset path mismatch	Sitemaps list image URLs under one path; rendered pages serve them from another. <i>Not verified</i> whether the sitemap paths resolve.	Low
Stale indexed page title	A legacy contact URL is indexed under an old title; the live URL 301s correctly and the canonical is right. Cosmetic.	Low

Crawler access is clean — this is not a robots problem

The site's `robots.txt` blocks no AI crawler. It disallows only admin, taxonomy, feed, and search paths, and carries an explicit content signal permitting AI training, search, and AI input. Whoever configured it did so deliberately and correctly. Meridian's invisibility is not caused by blocked access — a common and comforting misdiagnosis. The crawlers can read the site. There is not enough on it to read.

11 Entity consistency findings

Entity consistency is how confidently a machine can conclude that scattered mentions refer to one business. Low confidence produces hedged answers, or omission.

IDENTIFIER	VARIANTS LIVE	ASSESSMENT
Suite number	4 — Suite 1 (state record), Ste 2, Suite 20, none	Critical
Business name	6 — spacing, casing, and LLC-suffix variants	Critical
Street name	4 — abbreviated, spelled out, misspelled, omitted	Med
Handle root	3 — different roots across domain, Instagram, and the booking subdomain	Med
Practitioner credential	4 — APRN, ARNP, "Family Nurse Practitioner", and one source calling her a doctor	Critical
Facebook presence	2 live pages, different names, addresses, follower counts	Critical
Practitioner profiles	2 live, different emails, credentials, device brands, and price lists	Critical
Rating & count	6 distinct figures across platforms for one business on one day	Critical
Phone number	1 — consistent everywhere	Clean

Likely root cause, stated as inference: the practice occupies a single suite inside a shared salon-suite building. Different platforms have recorded the loft number, a neighbor's suite, and no suite at all. This is well-supported — the building address matches and the operator's directory lists the loft number that matches the state record — but it has not been confirmed with the business, and is labeled inference rather than finding.

The phone number row matters more than it looks. One clean, universally consistent identifier is the thread that lets a resolution system stitch these fragments back into one entity. Without it, this profile would likely have split into two or three distinct businesses in third-party data by now.

12 Content gaps

GAP	OBSERVED	COMPETITOR BENCHMARK
Total indexable pages	32	Competitor A: ~60+, including a treatment blog cluster
Blog / editorial	None	Two competitors publish category roundups that rank for the head term
Service page depth	665 words on the injectables page; head term used once; city named once; neighborhood never; practitioner never	Competitors run dedicated, deeper landing pages per service
Neighborhood / service-area pages	None. The five areas served appear only inside a Google Post	Competitors run geo-qualified landing pages
FAQ content	None, and no <code>FAQPage</code> markup	—
Practitioner authority page	About page names her in body text; generic "About Us" <code>H1</code> ; no license number, NPI, or verification link	Competitors put the named clinician in titles, headings, and schema
Before/after or outcomes content	None indexed	Standard in the category
Pricing transparency	None on the site; a full price list exists on a third-party profile	Mixed across competitors

Where the real gains are

The instinct here is "publish more." That is the slow path. Three faster moves come first:

- 1. Say what you already are.** Every attribute in §8 is true today and unpublished. Rewriting eight page titles and adding one honest positioning paragraph addresses query 10 without producing a single new article.
- 2. Put the head terms in the head positions.** The injectables page cannot answer an injectables query when the term is absent from its title, heading, and URL.
- 3. Move the reviews on-page.** 214 reviews already exist. Rendering a subset as real HTML with valid markup converts an existing asset from invisible to citable — no new content required.

Only after those does a blog earn its cost. And when it does, the highest-value first post is the one the competitors already proved works in this market: an honest, genuinely useful category roundup.

13 Local visibility findings

SIGNAL	STATUS
Google Business Profile — claimed and active	Strong. Correct address, correct hours, owner responses, a Post within the last week
Review volume and rating	Strong. 5.0 / 214 — 6th largest count in the local competitive set
Maps ranking	#2 in its own neighborhood; present for the metro head term
GBP website field	Points to the <code>http://www.</code> variant rather than the canonical
Service-area statement	Five areas named — but only inside a Google Post, not on any page
Review platform #2	Claimed, but 3.0 / 2 reviews. Actively harmful, and it feeds a listicle that ranks
Duplicate social pages	Two live Facebook pages splitting signal
Vertical directories	Three-plus unclaimed, all stale
RealSelf	No presence, in a category where it ranks for injectable queries
Apple Maps / Bing Places	Not checked in this sample

The local picture is a well-maintained Google presence surrounded by neglected everything-else. Since the neglected platforms are the ones feeding third-party editorial — and third-party editorial is what generated answers cite — the strong asset is not being converted.

14 Risk and compliance observations

Observations from public sources, not legal or regulatory advice. Anything below with regulatory implications should be reviewed by the practice's own counsel or compliance advisor.

OBSERVATION	WHY IT MATTERS	PRIORITY
A third-party page describes the practitioner as a physician	She holds a clear, active APRN license. Neither the practice nor its agents authored this text, but uncorrected public misstatement of a clinical credential is a regulatory and trust exposure in a licensed profession	High
A third-party profile publishes prices the practice does not publish itself	Prices quoted by a source the practice does not control may be stale. In aesthetics, advertised pricing carries consumer-protection implications	Med
Published hours conflict across four sources, including the practice's own markup	Consumer-experience and review risk before it is a visibility risk	High
No license number, NPI, or verification path on the site	Not required — but it is the cheapest available trust signal in a category where consumers are actively screening for credentials, and it strengthens machine entity resolution at the same time	Med
Two live practitioner profiles with different credential wording	Compounds the above; makes the correct credential harder for any system to determine	Med
Brand and device trademarks used throughout	Standard in the category. No misuse observed. Noted only for completeness	None

15 Scoring and priority matrix

AnswerFoundry Visibility Score — 27 / 100

This is AnswerFoundry's proprietary assessment methodology. It is a structured way to compare a business against itself over time and against observable competitor attributes. It is **not** a standardized industry metric, it is not calibrated against an external benchmark, and it should not be read as implying scientific precision. The reasoning for each category is shown so the number can be argued with.

CATEGORY	SCORE	REASONING
Entity accuracy	6 / 20	Four suite variants, six name variants, four credential variants, two live Facebook pages, two live practitioner profiles, six rating figures. Credit for one clean, universally consistent phone number and an accurate Google Business Profile
Website technical readiness	5 / 15	No service-page schema, no H1 on the homepage, reviews iframed off-domain, schema contradicting visible text, developer account in Person markup. Credit for clean crawler access, correct canonicals, and functioning sitemaps
Content coverage	7 / 20	32 URLs, no blog, thin service pages, head term absent from the money page's title and heading. Credit for 24 distinct service pages existing at all and one page ranking #1
Authority and citations	5 / 20	Absent from all four category roundups examined; no RealSelf; three-plus unclaimed stale directory profiles. Credit for a working manufacturer directory listing that demonstrably drives a #1 result
Competitive share of answer	3 / 15	2 of 8 scored unbranded queries, one of which surfaces incorrect data. Credit for #1 on a service term and strong Maps performance
Monitoring and measurement readiness	1 / 10	No baseline, no prompt log, no AI-referral segmentation, no review-count monitoring. Credit for an actively managed Google Business Profile
Total	27 / 100	Low score, unusually favorable prognosis — most of the deficit sits in fixable data and unwritten text rather than in missing capability, reputation, or spend

VISUAL 5 — PRIORITY MATRIX

	HIGH IMPACT	LOWER IMPACT
Low effort days	DO FIRST • Correct the 3.0 / 2-review platform listing • Fix the hours contradiction in schema • Standardize suite number everywhere • Merge or close the duplicate Facebook page • Request correction of the "doctor" credential claim • Rewrite 8 service-page titles with head terms • Update the footer review count to 214 • Point the GBP website field at the canonical URL	FILL IN • Fix the street-name misspelling • Resolve the sitemap image-path mismatch • Add <code>geo</code> and <code>sameAs</code> to the business node
Higher effort weeks	PLAN • Service schema across all 24 service pages • Bring reviews on-page as crawlable HTML with markup • Claim and correct all directory profiles • Establish a RealSelf presence • Build a real practitioner authority page • Pursue inclusion in the four category roundups	LATER • Neighborhood landing pages • Editorial program • Before/after outcomes content • Pricing transparency decision

Note where the weight sits. Eight of the highest-impact items are in the low-effort quadrant. That is unusual, and it is a direct consequence of the diagnosis: Meridian's problem is largely uncorrected data and unwritten true statements, not absent capability.

16 30-day actions

Objective: stop publishing contradictory information about yourself, and put the head terms where machines look.

#	ACTION	OWNER	EFFORT
1	Reconcile hours across the site's visible text, its structured data, and the Google Business Profile. Pick one truth and publish it in all three	Practice + web	1 hr
2	Standardize the address to the state-record suite number across every platform: review sites, financing partner, both social pages, manufacturer directory, booking platform, aggregators	Practice	3 hrs
3	Claim the second review platform, correct address and hours, and begin routing satisfied patients there to address the 2-review base	Practice	2 hrs + ongoing
4	Merge or permanently close the duplicate Facebook page; redirect followers to the canonical one	Practice	1 hr
5	Submit a correction request for the "doctor" credential claim, in writing, and keep a dated record of the request	Practice	30 min
6	Rewrite service-page titles and H1s so each contains the actual head term, the city, and where natural, the neighborhood	Web	3 hrs
7	Add one H1 to the homepage and resolve the builder's duplicated headings	Web	1 hr
8	Update the site footer review count to the actual figure, and set a monthly reminder to keep it current	Web	15 min
9	Point the Google Business Profile website field at the canonical HTTPS URL	Practice	5 min
10	Add a short, honest positioning paragraph — NP-owned, physician oversight, female-owned, years of experience, areas served — to the homepage and About page, in text, not an image	Practice	1 hr
11	Capture the measurement baseline: run the full prompt set, log every result, screenshot everything, before any of the above ships	AnswerFoundry	2 hrs

Item 11 is listed last but must happen *first*. Changes made before a baseline exists cannot be measured, and unmeasurable work is indistinguishable from work that didn't happen.

17 60-day actions

Objective: make the existing assets machine-readable, and claim the surfaces that feed generated answers.

#	ACTION	OWNER	EFFORT
12	Add valid <code>Service</code> schema to all 24 service pages, each linked to the business entity	Web	6 hrs
13	Replace the developer account in <code>Person</code> markup with the licensed practitioner; add <code>sameAs</code> pointing at her verifiable profiles	Web	2 hrs
14	Bring a rotating subset of reviews on-page as crawlable HTML with valid markup; keep the iframe widget if desired, but stop relying on it	Web	4 hrs
15	Add <code>geo</code> , <code>sameAs</code> , and a corrected <code>openingHoursSpecification</code> to the business node; adopt a medical-specific schema type if the operating model supports it	Web	2 hrs
16	Claim and correct every remaining directory profile; where a profile cannot be claimed, submit a written correction and log the date	Practice	4 hrs
17	Establish a RealSelf presence — the one high-visibility category source with no listing at all	Practice	2 hrs
18	Reconcile the second practitioner profile: decide which is canonical, align credential wording and pricing, or retire the secondary one	Practice	1 hr
19	Build a real practitioner page — named in the title and <code>H1</code> , credential stated exactly as licensed, license number, verification link, and a substantive biography	Practice + web	4 hrs
20	Deepen the three highest-intent service pages: what the treatment is, who it suits, what happens, recovery, honest FAQ. Add <code>FAQPage</code> markup only where the content genuinely qualifies	Practice + web	8 hrs
21	Re-run the full prompt set. Log everything. Compare against baseline	AnswerFoundry	2 hrs

18 90-day actions

Objective: earn presence in the third-party sources that decide this category's answers.

#	ACTION	OWNER	EFFORT
22	Pursue inclusion in the four category roundups identified in §9. Several accept submissions; all have a contactable author	AnswerFoundry	6 hrs
23	Publish one genuinely useful category resource of Meridian's own — the format competitors have already proven ranks here. It must be useful to a reader who never becomes a patient	Practice + AnswerFoundry	10 hrs
24	Add service-area pages for the five areas currently named only inside a Google Post	Web	8 hrs
25	Decide the pricing-transparency question. A third party is already publishing prices for this practitioner; the only real choice is whether Meridian controls that or not	Practice	Decision
26	Formalize review generation across both major platforms, with a documented, compliant request process	Practice	2 hrs + ongoing
27	Re-run the full prompt set. Produce the 90-day comparison against baseline, including results that did not move	AnswerFoundry	3 hrs

VISUAL 6 — 90-DAY ROADMAP

WORKSTREAM	DAYS 0-30	DAYS 31-60	DAYS 61-90
Measurement	Baseline captured	Cycle 2	Cycle 3 + comparison
Entity & accuracy	Address, hours, duplicates, credential correction	Directory claiming, profile reconciliation	Monitor for drift
Website technical	Titles, H1s, footer count	Service schema, Person schema, reviews on-page	Service-area pages
Content	Positioning paragraph	Practitioner page, 3 deep service pages	Category resource
Authority & citations	—	RealSelf, directory presence	Roundup inclusion outreach

19 Measurement plan

Every prompt run — in the baseline and in every cycle after — records the following fields. All of them, every time, whether the result is favorable or not.

FIELD	WHY IT'S RECORDED
Date and time	Answers change; an undated result is not evidence
Platform and, where visible, model version	Results are not comparable across platforms
Exact prompt text	Paraphrasing between cycles destroys comparability
Location context	Materially changes local results
Business mentioned — yes/no	The primary measure
Position or order, where meaningful	Being named third differs from being named first
Competitors mentioned, in order	Share of answer is relative
Citations or sources shown	The most actionable field in the log — it names what to influence
Accuracy of any description given	Being mentioned wrongly is its own failure mode
Sentiment	Recorded, but interpreted cautiously
Whether the response appeared personalized	Affects how much weight a single run deserves
Full response text and a screenshot	So the claim can be checked by someone who wasn't there

Alongside the prompt log

- **AI-referral traffic**, segmented in analytics by known assistant referrers — reported as directional, never as proof of causation
- **Review count and rating** on both major platforms, monthly
- **Indexed page count**, monthly
- **Directory profile status** — claimed, corrected, or outstanding
- **Roundup inclusion** — a binary count of the four identified sources

VISUAL 7 — COMPLETED VS. PENDING TRACKER

ITEM	STATUS	DATE
Baseline prompt set captured	PENDING	—
Hours reconciled across three surfaces	PENDING	—
Suite number standardized (9 platforms)	PENDING	—
Duplicate social page resolved	PENDING	—
Credential correction requested	PENDING	—
Service page titles rewritten (8)	PENDING	—
Homepage H1 added	PENDING	—
Service schema deployed (24 pages)	PENDING	—
Reviews rendered on-page	PENDING	—
Directory profiles claimed (3+)	PENDING	—
RealSelf presence established	PENDING	—
Practitioner authority page live	PENDING	—
Roundup inclusion (0 of 4)	PENDING	—
Cycle 2 comparison	PENDING	—
Cycle 3 comparison	PENDING	—

In a live engagement this table is the client's status page, updated as each item ships, with the completion date recorded. Nothing is marked complete without a dated artifact behind it.

20 Limitations and no-guarantee disclaimer

What this report is

A structured record of what publicly available sources said about one business on one day, and a professional assessment of the signals most likely influencing that. It is a diagnosis and a plan, not a prediction.

What was not tested

- **No conversational AI assistant was queried for this sample.** Findings come from web search results, Google Maps, and direct inspection of sources — the retrieval substrate assistants draw on, which is a reasonable proxy but is not a measurement of assistant behavior.
- Apple Maps, Bing Places, and the national provider registry were not checked.
- Traffic, ranking history, backlink profile, and Search Console data were unavailable — no client access.
- The identity of one out-of-area medical-directory profile is a name-and-city match only, and is not confirmed.
- Whether the site's sitemap image paths resolve was not verified.
- Current in-practice pricing was not confirmed with the business.

Inherent limitations of AI visibility testing

- **AI outputs change.** The same prompt run twice, minutes apart, can return different answers. Any single result is a snapshot, not a measurement.
- **Results vary** by date, model version, location, personalization, session history, and platform.
- **These systems are opaque.** Correlation between a change and a shift in mentions can be observed; causation generally cannot be proven, and this report does not claim it.
- **Third-party data corrections are requests, not commands.** Platforms accept, reject, or ignore them on their own timelines.
- **A single business in a single metro** does not establish that any of this generalizes.

No-guarantee statement

AnswerFoundry does not control ChatGPT, Google, Bing, Perplexity, Gemini, Claude, or any other third-party AI or search system, and **does not guarantee placement, citation, ranking, recommendation, or mention in any AI-generated answer.** No representation is made that any specific result, position, traffic level, lead volume, or revenue outcome will be achieved.

Recommendations reflect observed data and professional judgment as of the test date. Client results vary. Historical visibility does not indicate future visibility. Some work described here may also affect traditional search performance, but AI visibility and traditional SEO are not the same thing and should not be expected to move together.

This report contains no legal, medical, regulatory, or financial advice. Observations touching on professional licensure or advertising should be reviewed by the practice's own counsel or compliance advisor.

About this sample

The subject is a real, independently owned Orlando-area med spa, selected without its knowledge or participation from public information only. Its name, address, and practitioner identity have been changed, and competitors are identified by letter. No confidential information was used, and no source was accessed other than pages available to any member of the public. All findings are data-consistency observations with a named source type and an observation date; none constitutes a characterization of the business, its practitioner, or any competitor. Every business in this report — subject and competitors alike — appears to be a legitimately operated practice.

Any business that recognizes itself here may contact hello@answerfoundry.ai and this report will be amended or withdrawn on request, without argument.

What this looks like for your business

A Foundry Audit is this report, run on your business, with every AI assistant queried directly and logged — exact prompts, dates, full responses, screenshots. Every result, including the ones that don't flatter anyone.

Foundry Audit — from \$495. Credited toward your first month of implementation if you start within 14 days.
